Claude Accounting: Agent that can operate in any ERPs

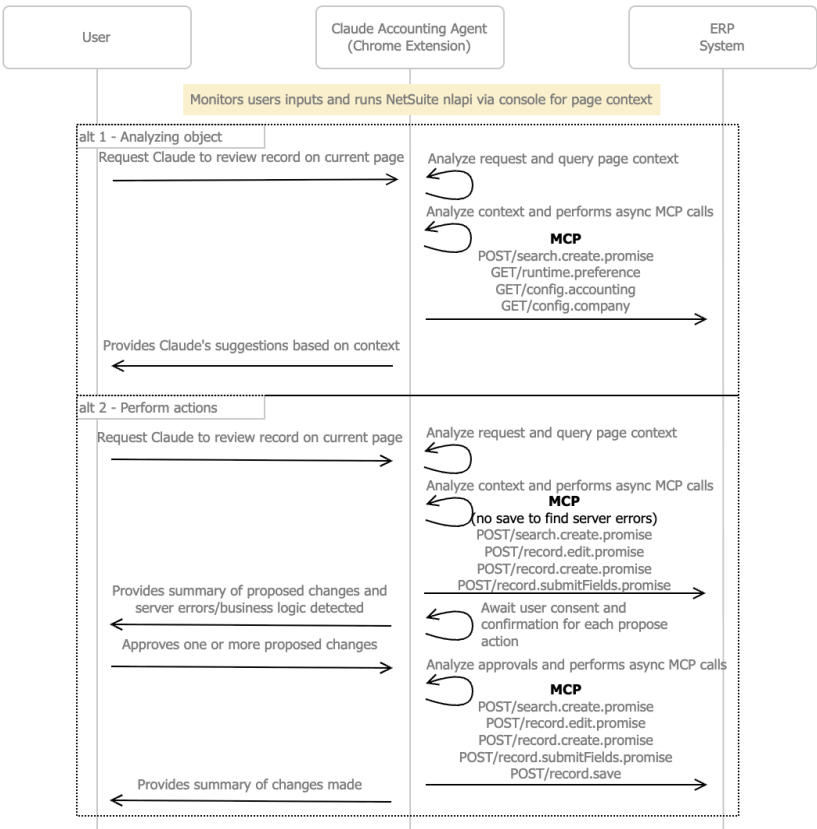

Micheal Sihavong

Claude Accounting is an agent that brings Claude to life via Chrome extension, operating within any ERP (Enterprise Resource Planning) system. Accountants can request Claude to analyze any object—transactions, reports, queries, or elements—within their ERP environment.

Example actions Claude Accounting can perform for accountants include:

- **Context-specific transaction handling:** Correcting taxes in locked periods by performing reversals and rebooking versus editing the existing transaction directly in open periods.
- **Business logic-driven answers:** Providing context-specific analysis such as explaining why open balances appear in A/R aging for fully reversed marketplace fees when separate entries were not properly applied, identifying permission restrictions that prevent record access or modification, and similar complex scenarios

Before executing any material actions, Claude provides an artifact-like interface that enables accountants to review and confirm each proposed action as illustrated in the figure above.
